Architecture and Design Specification

**Abstract:** This document describes the architecture and design specification of the openETCS onboard unit (OBU) model. The functional scope of the openETCS OBU model is to cover the functionality required for running on the ETCS level 2 Utrecht Amsterdam track. The OBU model is developed iteratively and the system model is documented in D3.5.x and the functional model is documented in D3.5.x, where x denotes the iteration.

## List of Figures

|                                                                                    |     |
|------------------------------------------------------------------------------------|-----|
| Figure 1. Scope of openETCS OBU model system according to ERA TSI Chapter 2.5..... | 5   |
| Figure 2. Top level architecture with external interfaces.....                     | 6   |
| Figure 3. DMI Interfaces.....                                                      | 6   |
| Figure 4. 2nd level system architecture view.....                                  | 7   |
| Figure 5. TrackMessages SysML diagram.....                                         | 11  |
| Figure 6. F2: ETCS Kernel SysML diagram.....                                       | 17  |
| Figure 7. Manage_TrackSideInformation_Integration component SysML diagram.....     | 21  |
| Figure 8. High level overview of the InformationFilter components.....             | 47  |
| Figure 9. Manage_ETCS_Procedures component SysML diagram.....                      | 48  |
| Figure 10. trainData component SysML diagram.....                                  | 59  |
| Figure 11. TrackAtlas component SysML diagram.....                                 | 71  |
| Figure 12. Mode_and_Level component SysML diagram.....                             | 79  |
| Figure 13. calculateTrainPosition SysML diagram.....                               | 89  |
| Figure 14. Structure of component SpeedSupervision_Integration.....                | 106 |
| Figure 15. Provide_Position_Report component SysML diagram.....                    | 119 |
| Figure 16. Manage_Radio_Communication component SysML diagram.....                 | 135 |
| Figure 17. ManageDMIInput SysML diagram.....                                       | 159 |
| Figure 18. ManageDMIOutput SysML diagram.....                                      | 159 |
| Figure 19. ManageTIUInput SysML diagram.....                                       | 164 |
| Figure 20. ManageTIUOutput SysML diagram.....                                      | 167 |
| Figure 21. DMI component SysML diagram.....                                        | 177 |

## Todo list

|                                                                                                                     |    |
|---------------------------------------------------------------------------------------------------------------------|----|
| list has to be completed.....                                                                                       | 1  |
| list and descriptions have to be checked for completeness.....                                                      | 1  |
| Hashtag has to be updated once the model and document are ready for release.....                                    | 2  |
| has to be completed .....                                                                                           | 4  |
| paragapoh has to be checked and extended to be more clear.....                                                      | 4  |
| check if figure is correct. Do we need this figure anyway? If so, make it more appealing.....                       | 4  |
| Figure is incomplete and erroneous... F2 is not connected, F2 exists twice .....                                    | 4  |
| Should this block be described using the new component description template? Section<br>needs to be completed ..... | 4  |
| to be completed.....                                                                                                | 9  |
| Chapter needs to be completed. Will there be more components?.....                                                  | 10 |
| section needs to be completed .....                                                                                 | 10 |
| Figure: [Put SysML diagram of component here] .....                                                                 | 11 |
| components should be listed here .....                                                                              | 12 |
| to be checked.....                                                                                                  | 12 |
| to be checked.....                                                                                                  | 17 |
| descriptions needs to be improved .....                                                                             | 17 |
| descriptions needs to be improved .....                                                                             | 17 |
| to be completed.....                                                                                                | 17 |

# 1 Introduction

A primary goal of the openETCS ITEA2 project is to provide a formal specification and a non-vital reference implementation of an ETCS onboard unit (OBU) according to the specification described in Subset-026 [1], defined by the European Railway Agency (ERA).

This deliverable, i.e. D3.5.x, describes the architecture and design specification of the openETCS onboard (OBU) model. As the development of the OBU model is done iteratively according to a SCRUM process, the last digit of the deliverable identifier, i.e. x, denotes the current iteration of the model. This document should be considered as a complement to the following project outcomes respectively deliverables:

- the corresponding SysML and SCADE models, available at <https://github.com/openETCS/modeling/tree/master/model/Scade/System>,
- the corresponding functional design description, i.e. D3.6.x, and
- the documentation of the generic openETCS Application Programming Interface (API), available at <https://github.com/openETCS/modeling/blob/master/API/description/api-description.pdf>.

## 1.1 Input Documents

The following documents have been the basis for the analysis, functional decomposition, and design of the openETCS OBU model:

- ERA Subset-026 [1]
- ERA TSI CCS Documents
- openETCS API documentation, available at <https://github.com/openETCS/modeling/blob/master/API/description/api-description.pdf>
- openETCS requirements, i.e. D2.1...9, available at <https://github.com/openETCS/requirements/tree/master/Reference>

list has to be completed

## 1.2 Software and Tools used for Development

The following software and tools have been used in the openETCS development process:

- SCADE System** Version 16.1b of SCADE System has been used for the the generation of SysML models.
- SCADE Suite** Version 16.1b of SCADE Suite has been used for the functional modelling of the openETCS OBU components. Executable models are generated via the SCADE Suite code generator (KCG), which has been certified for CENELEC EN 50128 at SIL 3/4.
- SCADE Display** Version 16.1b of SCADE Display has been used for the development of the Driver Machine Interface (DMI).

list and descriptions have to be checked for completeness

34 **GitHub** The web based Git repository hosting service GitHub has been used for distributed  
35 revision control and source code respectively model management.

### 1.3 36 **General Remarks on the openETCS OBU Model**

37 The openETCS OBU model has been developed according the specification given in ERA Subset-  
38 026 [1]. The software release of the openETCS OBU documented and described in this document  
39 is publicly available at <https://github.com/openETCS/modeling/tree/master/model>  
40 and refers to the commit corresponding to the following hashtag:

41 1c06cc2d4a0d8f27569e065e2a9edf924b453ff1

Hashtag has to be updated once the model and document are ready for release

42 In particular, the root of the SCADE System SysML model is located at <https://github.com/openETCS/modeling/tree/master/model/system> and the root of the functional SCADE  
43 Suite model is located at <https://github.com/openETCS/modeling/tree/master/model/Scade>.  
44  
45

46 Note that all components of the openETCS OBU have been developed from scratch, no existing  
47 components have been reused.

48

## **Part I**

49

# **System Architecture and Functional Breakdown**

50

## 2 System Architecture

has to be completed

The system architecture of the openETCS OBU is adopted from the system structure defined in ERA Subset-026, Chapter 2.5 [1]. Figure 1 shows which parts of the reference architecture are in the scope of the openETCS OBU model. Note that also specific parts of the ETCS trackside (e.g. Eurobalise and RBC blocks) have been modeled to have an integrated test environment, cf. dashed blue line in Figure 1.

### 2.1 Top Level Architecture and External Interfaces

Figure 2 shows the top level architecture with external interfaces E1, E2, ..., E9. The external interfaces are used for the communication between the openETCS OBU (dashed red line) and systems out of the scope of the openETCS project and the ETCS Onboard Unit System. In the following we give brief overview of the interfaces:

paragaphoh has to be checked and extended to be more clear

**E1:** In- and out flow between the Interlocking and the Eurobalise. Only relevant for controlled Eurobalises.

**E2:** In- and out flow between the Interlocking and Radio Block Control. This interface ensures the states or logics directly to the Radio Block Control and the other way back from the train to the interlocking.

**E3:** Input flow from the Eurobalise to the Balise Transmission Module or Antenna Unit (BTM) into the ETCS OBU.

**E4:** In- and out flow between the Radio Block Control and the Euroradio modul into the ETCS OBU. This interface is not active in ETCS levels 0 and 1 since there is no ETCS radio interaction between track and train in these levels.

**E5:** This interface is used for the interaction between the driver and the display (Driver Machine Interface, DMI), cf. Figure 3.

**E6:** This interface is a compound structure and combines the interfaces E3 and E4.

**E7:** Input interface to the odometry subsystem of the ETCS OBU. Used for sending information to the train if there is any movement outside the ETCS System, e.g. "cold movement".

**E8:** Input interface to the ETCS OBU to set configuration data such as fixed values, system values, national values and train configuration.

**E9:** In- and Out flow between the ETCS OBU and the train. This interface is used for the interaction between the Train and the ETCS OBU such as brake control, traction control, door control, etc.

check if figure is correct. Do we need this figure anyway? If so, make it more appealing.

### 2.2 Functional breakdown of the ETCS OBU

Figure 4 depicts the functional breakdown of the ETCS OBU block shown in Figure 2. The internal interfaces

Figure is incomplete and erroneous... F2 is not connected, F2 exists twice

Should this block be described using the new component description template? Section needs to be com

Figure 1. Scope of openETCS OBU model system according to ERA TSI Chapter 2.5. Functional blocks in the scope of openETCS have been marked by the dashed blue line. The dashed red line shows the OBU blocks in the scope of openETCS.

Figure 2. Top level architecture with external interfaces.

Figure 3. DMI Interfaces.

Figure 4. 2nd level system architecture view.

- 86 **I1:** In flow from the Balise Transmission Module (BTM or Antenna) to the "F2 ETCS Kernel"  
 87 through Runtime API in. Transmitted data are information from the Eurobalise.
- 88 **I2:** In flow from the Odometrie (ODO) to the "F2 ETCS Kernel" through Runtime API in.  
 89 Transmitted data are information from the movement of the train.
- 90 **I3:** In- and Out flow between the DMI Controller and the "F2 ETCS Kernel" through Runtime  
 91 API in and out. Transmitted data are information of driver action and display. See description  
 92 in figure of "External Interface E5".
- 93 **I4:** Out flow from "F2 ETCS Kernel" to the JRU manager through Runtime API out. Transmitted  
 94 data are all necessary information for a juridical recorder unit "black box".
- 95 **I5:** In- and Out flow between the Euroradio and "F2 ETCS Kernel" through Runtime API in and  
 96 out. Transmitted data are radio track information (RBC) and information to the track (RBC).

## **Part II**

# **Design Description**

### 3<sup>99</sup> General Design Decisions

100

to be completed

# 4 F1: Receive Information from Trackside

Chapter needs to be completed. Will there be more components?

## 4.1 ETCS Messaging: TrackMessages

section needs to be completed

### 4.1.1 Component Requirements

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Description         | <p>TrackMessages is a library containing functionality to:</p> <ul style="list-style-type: none"><li>• Transport TrainToTrack and TrackToTrain messages and packets using a compressed format which is conceptually close to the ETCS language as defined in Subset-026</li><li>• Compress trackside information and decompress it in the on-board unit, taking into account different baseline versions and providing transparent translation.</li><li>• Compress trainside information and decompress it in the track-side simulation models, taking into account different baseline versions and providing transparent translation.</li></ul> <p>As TrackMessages is a library with various components supporting all packets and messages defined in Subset-026, we have selected one exemplary function to document the concept. As only the packet/ message- related functionality is specific, this approach will allow a first understanding of the concept and the related interfaces. For a full discussion of the library, refer to the [specific chapter? document?]</p> <p>The function Read_P005 extracts a packet 5 (Gradient Profile) from the compressed packets data flow, if present. It translates the integer-coded compressed data with the help of the metadata in the header section of the CompressedPackets_T formatted data flow. After performing variable-level translation and exception detection, a baseline-3 conformal packet 5 is available for use within the relevant OBU functions.</p> |

|                        |                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input documents        | Subset-026, Chapter 6<br>Subset-026, Chapter 7<br>Subset-026, Chapter 8<br><br>The objective of this component (the full TrackMessages library) is to provide a full formalisation of above chapters in Subset-026                |
| Safety integrity level | 4                                                                                                                                                                                                                                 |
| Time constraints       | n/a (for the provided example function)                                                                                                                                                                                           |
| API requirements       | In the demonstrator context, the API is fully defined on SCADE model level. For integration with external systems (BTM, Radio, Subset-076 or Subset-94), additional conversion to/ from bit-level representation will be required |

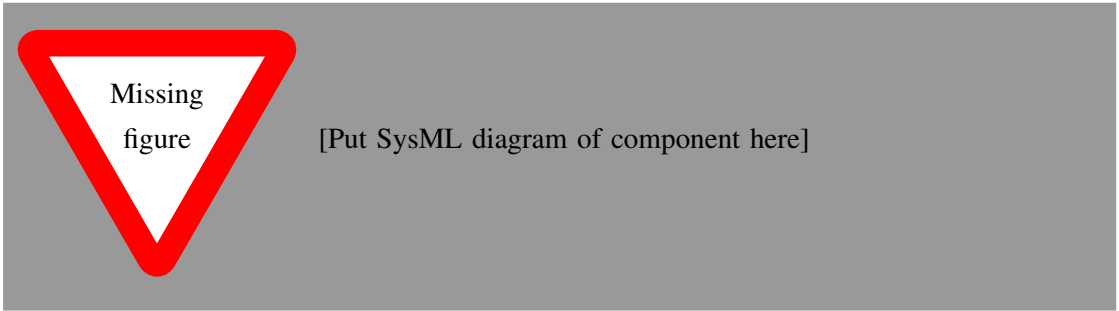

106 **4.1.2 Interface**

107 An overview of the interface of component TrackMessages is shown in Figure 5. The inputs and  
108 outputs are described in detail in Section 4.1.2.1 respectively 4.1.2.2.

109 **4.1.2.1 Inputs**

110 **4.1.2.1.1 Message\_In**

|             |                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input name  | Message_In                                                                                                                                                                                                                                                                                                                                                                                      |
| Description | Message_In takes the compressed track-to-train messages that have either been compressed by the trackside simulation components of the TrackMessages library, or have been filled by the API. All packets that are part of the same message are transmitted within one cycle of the model's execution. Message_IN is taking the compressed packet information from the track to train dataflow. |

**Figure 5. TrackMessages SysML diagram**

|                                         |                                                                                                                                                                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Valid range of values                   | The consistency of the metadata is checked at the input side. The ranges of the transported variables are checked at the conversion step (from integer format to SRS-conform format).                                        |
| Behaviour when value is at boundary     | n/a                                                                                                                                                                                                                          |
| Behaviour for values out of valid range | The content of this input is not checked, as any issues will be found at conversion level. If the metadata are not matching the search criteria the packet will be considered as non existent and will therefore be ignored. |

| Behaviour for values out of valid range | <p>The component is prepared for the upcoming error/exception handling concept. An error flag is, at the moment, raised internally if any of the compressed input values is out of range. A hierarchical error processing is foreseen.</p> <p>The types that have been defined in the package S026_7 do not provide any default/ invalid value. The following fields are therefore set to an arbitrary value upon reception of an out-of-range value from track side, and the internal error flag is raised:</p> <ul style="list-style-type: none"> <li>• q_dir Q_DIR:<br/>set to: Q_DIR_Both_directions</li> <li>• q_scale Q_SCALE:<br/>set to: ENUM_Q_SCALE_10cm</li> <li>• q_newcountry Q_NEWCOUNTRY:<br/>set to:[TM_conversions::ENUM_Q_NEWCOUNTRY_same   TM_conversions::ENUM_Q_NEWCOUNTRY_not_same]</li> <li>• q_newcountry Q_NEWCOUNTRY:<br/>set to: TM_conversions::ENUM_Q_NEWCOUNTRY_not_same</li> <li>• q_linkorientation Q_LINKORIENTATION:<br/>set to: TM_conversions::ENUM_Q_LINKORIENTATION_reverse</li> <li>• q_linkreaction Q_LINKREACTION:<br/>set to: TM_conversions::ENUM_Q_LINKREACTION_Train_trip</li> </ul> |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                       |     |
|-----------------------------------------------------------------------|-----|

| Description | <p>RECV_ReadPackets extracts packet data information and raw compressed packet data from the compressed packets data flow, using filter criteria provided through parameter inputs:</p> <ul style="list-style-type: none"> <li>• NID_PACKET: search for a specific packet.</li> <li>• Version Number: search for a specific version number.</li> <li>• Q_DIR: search for packets that are only valid for a specific direction.</li> <li>• Serial number: search for a specific packet instance, if several instances of a given packet type exist.</li> <li>• F_Version: Flag to decide whether to evaluate or ignore packet version information.</li> <li>• F_id: Flag whether to evaluate or ignore packet serial number information.</li> </ul> <p>The operator TM_lib_internal::RECV_ReadPackets takes a set of parameter data to:</p> <ol style="list-style-type: none"> <li>1. Search the metadata of the compressed packets data flow using the provided parameters to determine if a matching packet is contained in any given cycle.</li> <li>2. Output the flag "received" exactly in any cycle a matching packet is found</li> <li>3. Output an array of compressed packet data that is filled with the data from the identified packet.</li> </ol> |

#### 122 4.1.3.2.2 Interface

123 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
 124 above) respectively the SCADE generated documentation.

## 5 F2: ETCS Kernel

In this chapter we describe the main components of the openETCS OBU model. Section 5.1 gives an overview of the external interfaces of this functional block and gives a brief overview of its components and their interaction. The following Sections 5.2 to 5.14 give a detailed description for each of the components in F2: ETCS Kernel.

### 5.1 ETCS Kernel Overview

The ETCS Kernel module consists of the 13 functional components, i.e. F1.1 to F1.13 as depicted in Figure 6. In the following we briefly describe the functionality of these subcomponents.

**F2.1: Manage\_TrackSideInformation\_Integration** This component is responsible for receiving Eurobalise telegrams and Euroradio messages from the API and performs several consistency checks on the inputs. For details see Section 5.2.

to be checked

**F2.2: Manage\_ETCS\_Procedures** This component describes the Start of Mission procedure of the train until the current status will change to another mode, level or other procedure. For details see Section ??.

descriptions needs to be improved

**F2.3: trainData** Implementation of the train data with the corresponding interfaces to track, driver and RBC. For details see Section ??.

descriptions needs to be improved

**F2.4: TrackAtlas** t.b.d. For details see Section ??.

to be completed

**F2.5: Mode\_and\_Level** Defines the status of the ETCS regarding on-board functional status and track infrastructure. For details see Section ??.

descriptions needs to be improved

**F2.6: calculateTrainPosition** The purpose of this component is to calculate the locations of linked and unlinked balise groups and the current train position while the train is running along the track. For details see Section ??.

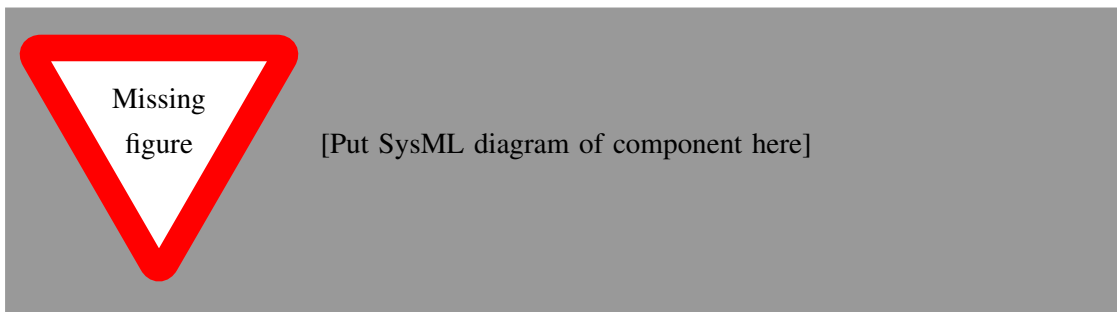

Figure 6. F2: ETCS Kernel SysML diagram

152 **F2.7: SpeedSupervision\_Integration** This component monitors the current speed of the train  
 153 and its location to ensure that the speed remains within the given speed and distance limits.  
 154 For details see Section ??.

155 to be checked

156 **F2.8: Provide\_Position\_Report** The component builds a position report for the RBC, i.e.,  
 157 message 132, and provides it as an output. For details see Section ??.

158 to be checked

159 **F2.9: Manage\_Radio\_Communication** This component implements the onboard management  
 160 of a single communication session with the track, i.e. a single RBC. It controls the estab-  
 161 lishment, maintenance and termination process of a radio communication session and steers  
 162 the underlying communication safety layer as well as the mobile device. Those and the data  
 163 transfer itself are not part of this component. For details see Section ??.

164 **F2.10: ManageDMIInput** This component handles messages respectively data coming from  
 165 the Driver Machine Interface (DMI) to the ETCS OBU. For details see Section ??.

166 to be checked

167 **F2.11: ManageDMIOutput** This component handles messages respectively data being send  
 168 from the ETCS OBU to the DMI. For details see Section ??.

169 to be checked

170 **F2.12: ManageTIUInput** This component handles messages respectively data coming from  
 171 the Train Interface Unit (TIU) to the ETCS OBU. For details see Section ??.

172 to be checked

173 **F2.13: ManageTIUOutput** This component handles messages respectively data being send  
 174 from the ETCS OBU to the TIU. For details see Section 5.14.

175 to be checked

## 176 5.1.1 External Interfaces

177 This section gives a detailed overview of the external inputs and outputs of module F2: ETCS  
 178 Kernel.

### 179 5.1.1.1 External Inputs

#### 180 5.1.1.1.1 [Input 1 name]

|                                         |                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------|
| Input name                              | [Name of the input]                                                          |
| Description                             | [Brief description of the input]                                             |
| Source                                  | [Name of the source component]                                               |
| Type                                    | [Type of the input]                                                          |
| Valid range of values                   | [Complete list of valid values]                                              |
| Behaviour when value is at boundary     | [Description of components behaviour when input value is at bound-ary]       |
| Behaviour for values out of valid range | [Description of components behaviour when input value is out of valid range] |

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|

#### 181 5.1.1.1.2 [Input 2 name]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Input name                                                            | [Name of the input]                                                                               |
| Description                                                           | [Brief description of the input]                                                                  |
| Source                                                                | [Name of the source component]                                                                    |
| Type                                                                  | [Type of the input]                                                                               |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when input value is at boundary]                             |
| Behaviour for values out of valid range                               | [Description of components behaviour when input value is out of valid range]                      |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 182 5.1.1.2 External Outputs

##### 183 5.1.1.2.1 [Output 1 name]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | [Name of the output]                                                                              |
| Description                                                           | [Brief description of the output]                                                                 |
| Destination                                                           | [Name of the destination component(s)]                                                            |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

##### 184 5.1.1.2.2 [Output 2 name]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | [Name of the output]                                                                              |
| Description                                                           | [Brief description of the output]                                                                 |
| Destination                                                           | [Name of the destination component(s)]                                                            |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

## 5.2<sub>185</sub> F2.1: Manage\_TrackSideInformation\_Integration

### 186 5.2.1 Component Requirements

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Description         | <p>The functional block “Manage_TrackSideInformation_Integration” is responsible for receiving Eurobalise telegrams and Euroradio messages from the API and performs several consistency checks on the inputs.</p> <p>The block collects the telegrams of balises in order to build balise group messages. Euroradio messages are always delivered as a whole message. On each message, a consistency check is performed, before the data is validated according to the driving direction of the train. In general, messages not designated for the current driving direction of the train are not forwarded for further processing. After applying consistency checks, the data direction is validated. Finally, the received message is handled in the InformationFilter subcomponent. The InformationFilter may, depending on level, mode and announced level transitions and radio handover scenarios, let information pass immediately, reject information, or buffer information for some cycles until certain conditions apply and the information will be passed. Information in this sense is packets in the context of messages.</p> |

|                        |                                                                                                                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input documents        | See subcomponents.                                                                                                                                                                                                                                                                          |
| Safety integrity level | 4                                                                                                                                                                                                                                                                                           |
| Time constraints       | The component has to be able to receive balise telegrams and radio messages according to the ETCS performance requirements, c.f. [? ]. In highspeed traffic, a group of 8 balises must be read in about 250 msec. In addition, 1 message per sec. on the radio interface is to be expected. |
| API requirements       | Interfaces to this unit are defined in the API sections [BTM], [EU-RORADIO], [ODO]. In these sections, also a detailed definition of the concepts implemented on those interfaces is documented. <div>reference sections correctly once these are completed</div>                           |

5.2.2 Interface

An overview of the interface of component Manage\_TrackSideInformation\_Integration is shown in Figure 7. The inputs and outputs are described in detail in Section 5.2.2.1 respectively 5.2.2.2. Subcomponents are described in Section 5.2.3.

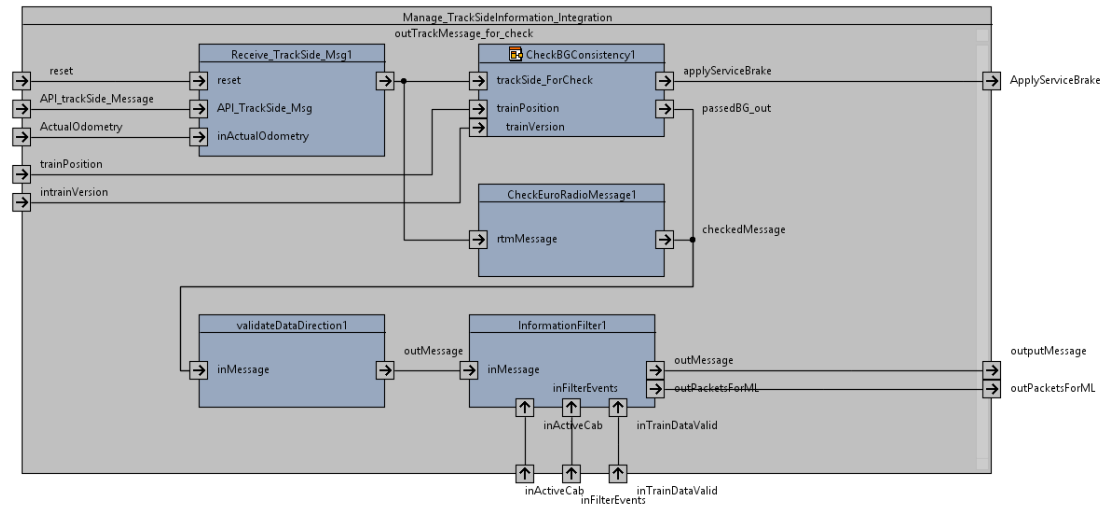

Figure 7. Manage\_TrackSideInformation\_Integration component SysML diagram.

5.2.2.1 Inputs

| Input name  | API_trackSide_Message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Description | <p>Track side message received from the API. The API performs pre-processing of RTM and BTM messages and delivers a maximum of a single message per cycle. The structure of this message is defined in the API [BTM] and [EURORADIO] sections. The input consists of the following main components:</p> <p><b>valid</b> (bool) Indicates the information has been refreshed in the cycle.</p> <p><b>true</b> : Information is updated in this cycle.</p> <p><b>false</b> : Information is unchanged.</p> <p><b>systemTimeMsgReceived</b> (Obu_BasicTypes_Pkg::T_internal_Type): Timestamp when the system (i.e. the train) has received the message. The parameter is set either by RTM or by BTM modules.</p> |

**msg\_type** (Common\_Types\_Pkg::MsgSource\_T) source of this information.

**msrc\_undefined** indicates the information is not defined. This input is expected when valid flag is false.

**msrc\_Euroradio** indicates the information is a euroradio message.

**msrc\_Eurobalise** indicates the information is a balise telegram.

Other values of this enumeration are not expected in this model.

**btm\_msg** (API\_Msg\_Pkg::API\_TelegramHeader\_T) Telegram header with some additional information provided by the btm-module. The header is structured as follows:

**present** (bool) Telegram information has been received via btm and the information of this telegram is present.

**checkResult** (bool) The telegram is checked after reception at the btm. Typical checks are checksum-tests or checks at conversion of the types from bit-layout to the presentation in the evc. If checkResult is false the information may not be used. The information is evaluated in the checkBGConsistency component of this model.

**api\_bad\_balise\_received** (bool) The telegram reception was disturbed. Again, the information related to this telegram may not be used in the EVC.

**api\_header** (API\_Msg\_Pkg::API\_TelegramHeader\_T) Header of the telegram similar to subset 26 section 8.4.2.1. The information in the telegram is not packed on bit-boundaries.

**centerOfBalisePosition** (BG\_Types\_Pkg::centerOfBalisePosition\_T) Location of the balise as determined by the antenna of the train. The information is extended with inaccuracies of the measurement given by the BTM.

**rtm\_msg** (API\_Msg\_Pkg::API\_RadioMsgHeader\_T) Radio message header with some additional information added by the RTM module. The information is structured as follows:

**present** (bool) Radio message has been received via rtm and the information of this message is present.

**apiConsistencyError** (bool) The message is checked after reception at the btm. Typical checks are checksum-tests or checks at conversion of the types from bit-layout to the presentation in the evc. If apiConsistencyError is false the information may not be used. The information is evaluated in the checkRadioMessage component of this model.

**Radio\_Common\_Header** (Radio\_Types\_Pkg::Radio\_TrackTrain\_Header\_T) Header of the radio-message as defined in subset 26 section 8.4.4.6.1. In the SRS, depending on the concrete message, some optional variables are defined. In our implementation all optional variables are foreseen. In order to indicate the availability of variables the component radioMetadata is used (see below).

**radioMetadata** (Common\_Types\_Pkg::RadioMetadata\_T) Metadata for optional variables in the common radio message header. For each optional component a presence indicator of type bool is in the list.

**sendingRBC\_Id** (Common\_Types\_Pkg::RBC\_Id\_T) Identifies the RBC as it is known at the RTM. Information is added to the interface in the RTM.

**packets** (Common\_Types\_Pkg::CompressedPackets\_T) Packets as received as a part of the telegram or radio message. The structure is set-up and can be accessed by library routines of the trackMessages component of the system. In the manage\_trackside\_Messages component packets may be changed to being absent (e.g., by the function validateDataDirection or by the InformationFilter.). If packets have to be treated only this valid indicator is changed. No other parts of the packets are accessed.

|        |                                                                              |

| Type   | API_Msg_Pkg::API_TrackSideInput_T                                            |

|                                                                       |                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Valid range of values                                                 | Access to the information has to be guarded by the valid flag and similar flags deeper in the structure of the interface. Checks on individual values of message components, telegrams and packets are part of the decoding function. We assume information to be valid in this part of the system. |
| Behaviour when value is at boundary                                   | n/a (structure)                                                                                                                                                                                                                                                                                     |
| Behaviour for values out of valid range                               | n/a                                                                                                                                                                                                                                                                                                 |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | n/a                                                                                                                                                                                                                                                                                                 |

#### 194 5.2.2.1.3 ActualOdometry

|                                                                       |                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input name                                                            | ActualOdometry                                                                                                                                                                                                                                                                                                                     |
| Description                                                           | Odometry data provided by the external odometry module of the train. It contains relative location information with inaccuracies. In this model only information related to the position of the train is used (odo-component). A valid flag of the odometer input indicates the hardware is working and the parameter may be used. |
| Source                                                                | Odometer<br>Proposal: Use input name of F2 here for consistency and traceability.                                                                                                                                                                                                                                                  |
| Type                                                                  | Obu_BasicTypes_Pkg::odometry_T                                                                                                                                                                                                                                                                                                     |
| Valid range of values                                                 | From the ODO component the nominal position is used. No plausibility checks on the component are done. Any integer value is allowed.                                                                                                                                                                                               |
| Behaviour when value is at boundary                                   | Boundary value may lead to jump of the calculation in negative ranges. As a result the train may not being able to complete the reading of a balise group. In consequence, this results in a balise group error and in a service brake reaction of the train.                                                                      |
| Behaviour for values out of valid range                               | Same as description at boundary.                                                                                                                                                                                                                                                                                                   |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Same as description at boundary.                                                                                                                                                                                                                                                                                                   |

#### 195 5.2.2.1.4 reset

|            |       |
|------------|-------|
| Input name | reset |
|------------|-------|

|                                                                       |                                                                                                                                                                                                                                                                                                                                 |                                                                       |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Description                                                           | The reset input is used to delete all data stored in the module (e.g. collected balise telegrams, which do not yet form a complete message). If the input is set to true, all data kept in the module is deleted and no input is accepted. The reset option is to be used when the EVC is started or in system error scenarios. |                                                                       |
| Source                                                                | Environment                                                                                                                                                                                                                                                                                                                     | Proposal: Use input name of F2 here for consistency and traceability. |

| Description                                                           | Contains the current position of the train. This input is used for validation of the direction of packets and for checks of balise groups. Most important information in this input is the LRBG and the prevLRBG component. This identifies the last two balise group passed by the train. |

|                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description                                                           | <p>For monitoring the safe radio connection, it is necessary that the time between two packets is less than the value of T_NVCONTACT. In situations like level changes or announced radio holes, not the timestamp of the last message is relevant for comparison, but the timestamp of the last relevant event. This can for example be the timestamp of the level change or the timestamp of the moment, when the train was passing the end of the radiohole.</p> <p>For performing this check, the timestamp of the last relevant event is provided to the model as an T_internal_Type-type.</p> |

| Valid range of values | <p>This input is a complex structure consisting out of the following components:</p> <p><b>pendingL1Transition</b> (bool) Indicates if an announced LEVEL 1 transition is present. Used for Level filter exception [1]. The information is indicating the status. Note: this indication can be evaluated based on information available in the InformationFilter. The input is not used from outside the main component Manage_TrackSide_Information.</p> <p><b>pendingL2L3Transition</b> (bool) Indicates if an announced LEVEL 2 or Level 3 transition is present. Used for Level Filter exception [2]. The information is indicating the status. Note: this indication can be evaluated based on information available in the InformationFilter. The input is not used from outside the main component Manage_TrackSide_Information.</p> <p><b>pendingAckOfTrainDataFromRBC</b> (bool) Indicates if the acknowledgement of train data is pending. Used for Level filter exception [3].</p> <p><b>emergencyStopAccepted</b> (bool): Indicate if the train performs an emergency brake. Used for Level filter exception [5].</p> <p><b>lastAckTextMessageId</b> (int) The ID of the last acknowledged text message ID. Used for Level filter exception [12]. The SRS requires text messages to restrict from double sending to the DMI when handled in the filter. This function is currently not implemented.</p> <p><b>pendingNTCTransition</b> (bool) Indication if an announced LEVEL NTC transition is present. Used for Level filter exception [6,7].</p> <p><b>SPPAndGradientOnBoard</b> (bool) Speed Profile and Gradient Profile received and available on board. This information may be part of the actual incoming message.</p> <p><b>MACoverNotFullLength</b> (bool) MA does not cover full length of the trip. Information from trackAtlas.</p> |

| Description | <p>Combines both balise and radio messages to one common datatype. This datatype contains all variables and packets, which are possible for the given scenario. In each cycle at most one valid message is put to the output. The InformationFilter might take the last processed one or a message from stack - depending on the information stored and on the status of the evc. The component consists of the following building blocks:</p> <p><b>valid</b> Information about the status of this message.</p> <p><b>true</b> The information is valid, a new message is now visible at the output. The valid flag (and the message as such) will only be present for one cycle.</p> <p><b>false</b> No valid message is available.</p> |

**source** (Common\_Types\_Pkg::MsgSource\_T) Source of this information.

**msrc\_undefined** Indicates the information is not defined. This input is expected when valid flag is false.

**msrc\_Euroradio** Indicates the information is a euroradio message.

**msrc\_Eurobalise** Indicates the information is a balise telegram.

Other values of this enumeration are not expected in this model.

**radioMetadata** (Common\_Types\_Pkg::RadioMetadata\_T) Metadata for optional variables in the common radio message header. For each optional component a presence indicator of type bool is in the list.

**BG\_Common\_Header** (BG\_Types\_Pkg::BG\_Header\_T) Balise group message header with some additional information. This header collects information from the balise telegram headers together with the location and orientation of the balise group related to the driving direction.

**Radio\_Common\_Header** (Radio\_Types\_Pkg::Radio\_TrackTrain\_Header\_T) Radio message header with some additional information added by the RTM module. Variables of messages which are not present in all messages are available in the header, but controlled by the radio metadata.

**packets** (Common\_Types\_Pkg::CompressedPackets\_T) Packets as received as a part of the telegram or radio message. The structure is set-up and can be accessed by library routines of the trackMessages component of the system. In the manage\_trackside\_Messages component packets may be changed to being absent (e.g., by the function validateDataDirection or by the InformationFilter.). If packets have to be treated only this valid indicator is changed. No other parts of the packets are changed.

| Description | <p>The InformationFilter component has to provide information to the EVC components according to the actual level and radio state. In order to trigger the level change level management needs to know about availability of track profiles and other components in order to select the correct mode and level. This output provides information relevant to trigger level transitions. The data will be accumulated in the InformationFilter until the position for the level change has been reached. The output structure consists of the following components:</p> <p><b>P41</b> (Packet_Types_Pkg::P41_LevelTransitionOrders_T) Packet 41 (level transition order).</p> <p><b>P46</b> (Packet_Types_Pkg::P46_LevelTransitionOrders_T) Packet 46 (conditional level transition order).</p> <p><b>LRBG</b> (NID_LRBG) Reference LRBG for the level transition order..</p> <p><b>referenceLocation</b> (Obu_BasicTypes_Pkg::L_internal_Type) Location of the reference LRBG. This location has to be used as reference for calculating the level transition position.</p> <p><b>P12_received</b> (bool) Packet 12 (Level 1 Movement Authority) has been received at the InformationFilter subcomponent in the context of this level transition.</p> <p><b>P15_received</b> (bool) Packet 15 (Level 2/3 Movement Authority) has been received at the InformationFilter subcomponent in the context of this level transition.</p> <p><b>P21_received</b> (bool) Packet 21 Gradient Profile) has been received at the InformationFilter subcomponent in the context of this level transition.</p> <p><b>P27_received</b> (bool) Packet 27 (International Static Speed Profile) has been received at the InformationFilter subcomponent in the context of this level transition.</p> |

| Description                             | Even if an incoming radio message is rejected or kept for some time in the InformationFilter buffer some information needs to be made available for maintaining the communication session with the RBC, e.g., the timestamp of the received message and acknowledgment of message reception based on the ACK flag. No other information of this message is to be used in the EVC. This concept might be improved when radio management functions are rearranged. |
| Destination                             | Radio Management                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                         | Proposal: Use input name of F2 or the exact SCADE component name here for consistency and traceability.                                                                                                                                                                                                                                                                                                                                                          |

| Description         | <p>This function defines the interface of the OBU model to the openETCS generic API for Eurobalise and Euroradio messages. On the interface, either a valid telegram/message is provided or a telegram/message is indicated which could not be received correct when passing the balise or receiving the radio message. The function passes a balise telegram without major changes of the information to the next entity for collecting the balise group information. This entity collects telegrams received via the interface into Balise Group Information. In case of a radio message, the message is converted to an internal format for further processing and passed without changing the information contained.</p> <ul style="list-style-type: none"> <li>• The decoding of balises is done at the API. Also, packets received via the interface are already transformed into a usable shape.</li> <li>• Only packets used inside the current model are passed via the interface.</li> <li>• Treatment of Packet 5: Linking Information. Linking Information is added to the linking array starting from index 0 without gaps. Used elements are marked as valid. Elements are sorted according to the order given by the telegram sequence.</li> <li>• Telegrams received as invalid are passed to the “Check-Function” to process errors in communication with the track side according to the requirements and in a single place. Telegrams are added to the telegram array starting from index 0 without gaps. Used elements are marked as valid. Elements are stored according to the order given by the telegram sequence.</li> <li>• This function does not process information from the packets. The information is passed to the check without further processing of the values.</li> </ul> |

|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description            | <p>The function "Receive_TrackSide_Msg" collects the telegrams in an array. If one or more telegrams are received multiple times, either the whole the array or single telegram should be deleted.(e.g.if the train moves back.) The balises in a group are to be expected in a certain distance from each other. The function "Receive_TrackSide_Msg" checks if the telegrams has been received in due time and at the right expected location.</p> <p>The function "CheckBGConsistency" verifies the completeness and correctness of the received telegrams from balise groups and composes the balise message from the received telegram array (input from "Receive_TrackSide_Msg"). A balise message is built from at least one telegram and a maximum of 8 telegrams. When linking information is used on-board, only balise groups marked as linked and included in the linking information and balise groups marked as unlinked shall be taken into account.</p> <ul style="list-style-type: none"> <li>• A message is still complete and correct, if a telegram is missing (or not decoded or incompletely decoded), and this telegram is duplicated within the balise group and the duplicating one is correctly read.</li> <li>• In case of multiple balises, the order of the balises must be either ascending (nominal) or descending (reverse).</li> <li>• A message is not correct, if a message counters (M_MCOUNT) equals 254 (that means: The telegram never fits any message of the group). A message counter can equal 255 (that means: The telegram fits with all telegrams of the same balise group) and all other values must be the same.</li> </ul> <p>The orientation of the BG and the running direction of the train are calculated in this block. When linking information is used on-board, the check, if the message of linked balise group has been received in due time and at the expected location, will be performed in "Calculate Train Position". The checks on the validity of the data in the packets and the validity with respect to the direction of motion will be performed in other modules, e.g. "ValidateDataDirection".</p> |

| Description            | <p>The component “CheckEuroradioMessage” performs consistency and timing checks on the received radio message. These checks are:</p> <ul style="list-style-type: none"> <li>• Checking the message sequence.</li> <li>• Check if the message violates timing constraints (T_NVCONTACT).</li> <li>• Check if all mandatory elements are included.</li> <li>• Check if no elements are included, which are forbidden for the given message id.</li> </ul> <p>Messages, which violate one or more of these criteria are marked as invalid in the message header and the component signals the reason for the invalidation via different flags as described in the SCADE model.</p> |

**Description** The filter receives track information (balise and radio) and filters them depending of the mode, level and source of the message. Only messages that pass the filter are valid and should be considered by other ETCS subsystems. Figure 8 shows the highlevel decomposition of the functionality. The filter is consists of four components: FirstFilter, SecondFilter, ThirdFilter and TransitionBuffer.

**FirstFilter** This filter performs filtering of messages based on the current ETCS level. The decisions taken process is described via a big decision table which contains rows for every packet and columns for every ETCS level. This table encodes also if certain additional information is necessary to filter a message like pending ETCS Level transitions. Based on this filter packets of an incoming message is either rejected, accepted or the whole message is put in the TransitionBuffer. Messages are put in the TransitionBuffer if there is an announced level transition and the received message is only valid for the upcoming level.

**SecondFilter** The SecondFilter mainly considers messages that are received via Euroradio. Certain messages are directly rejected while other may be stored in the TransitionBuffer. The buffer is used to store messages that are received from non supervising RBCs, but will be reevaluated after a RBC transition.

**ThirdFilter** The last filter is functionally very similiar the the First-Filter, however it filters depending on the mode. It also contains a decision table with rows for every packet but the columns are modes.

**TransitionBuffer** The InformationFilter uses two Transition-Buffers. One is used to store up to three messages for the ETCS level transition and the other buffer is used for RBC transitions. The buffer is designed as a ring buffer and message are read in FIFO order.

### 245 5.3.2 Interface

246 An overview of the interface of component Manage\_ETCS\_Procedures is shown in Figure 9. The  
 247 inputs and outputs are described in detail in Section 5.3.2.1 respectively 5.3.2.2. Subcomponents  
 248 are described in Section 5.3.3.

| Description            | This component switch to Level NTC and Mode SN after completion of the awakening of the train.                                                                                                                                                              |

| Description            | <p>Implementation of the train data with the corresponding interfaces to track, driver and RBC.</p> <p>This component provides the storage of train data and the procedures necessary for updating data and controlling interfaces for validating train data at the DMI and to the RBC.</p> <p>The scope of train data is defined in section 3.18.3 of the SRS. Train data are qualifying some safety relevant properties of the train like the length of the train, maximal speed and brake behaviour.</p> <p>During startup of the EVC a first definition of the train data is received from the train interface unit (TIU). During Start of Mission the data is updated resp. validated by the driver via action on the Driver Machine Interface (DMI). The driver may change some of the data. He has to confirm the set of data before being able to push the start button.</p> <p>When setting up a radio session to an RBC the evc has to send the actual train data to the RBC for validation: Message Flow:</p> <ul style="list-style-type: none"> <li>• sending Message 129 (Validated Train Data)</li> <li>• receiving Message 8 (Acknowledgment of Train Data) is processed as apart of the validation procedure with the RBC.</li> <li>• sending Message 146 (Acknowedement) in the context of this message flow. T_TRAIN parameter of the messages is used to confirm the association of the messages.</li> </ul> <p>The trainData component uses a dedicated state for controlling the reception of the acknowledgement.</p> |

| API requirements       | Train Data needs systemtime for stamping messages, access to input from the track messages and access to the output of RBC messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 290 5.4.2 Interface

Figure 10. trainData component SysML diagram

291 An overview of the interface of component trainData is shown in Figure 10. The inputs and  
292 outputs are described in detail in Section 5.4.2.1 respectively 5.4.2.2. Subcomponents are  
293 described in Section 5.4.3.

294 5.4.2.1 Inputs

295 5.4.2.1.1 reset

|                                                                       |                                                                                                                |

| Input name  | trainDatafromTIU                                                                                                                                                                                                                                                                                                                                                                     |
| Description | <div>This work is licensed under the <a href="#">OpenETCS Open License Terms (OOL)</a>.</div> Train data received via TIU. The availability of data is indicated with the valid flag. This data is expected to be received in the first place. In the current implementation it is not supported to change data after a mission has been started. The structure covers the following |

|                                                                       |                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Valid range of values                                                 | Input with valid information is indicated with the valid flag.                                                                                                                                                                                    |
| Behaviour when value is at boundary                                   | n/a                                                                                                                                                                                                                                               |
| Behaviour for values out of valid range                               | When valid flag indicates false the data to be used is assumed to be default values. The component is not used when valid flag is false.                                                                                                          |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Information is only expected at Start of Mission Procedure. Once the information is successfully received it is not considered any more. Change of train data by train during mission is not supported by this version of the openETCS OBU model. |

| Description | <p>Train data received via DMI from the driver. The availability of data is indicated with the valid flag. The data is expected as a mandatory parameter during start of mission. In the current implementation it is not supported to change data after a mission has been started. The structure consists of the following components:</p> <p><b>valid</b> (bool): valid indicator for this component. The data has been received from DMI. The flag is set to TRUE for a single cycle.</p> <p><b>systemTime</b> (Obu_BasicTypes_Pkg::T_internal_Type): timestamp set by the DMI. The component is not used by trainData.</p> <p><b>trainCategory</b> (NC_TRAIN): Train category used for the static speed profile calculation. Thanks to NC_TRAIN, the train knows the SSP it must obey. Each bit represents one category. A train can belong to various categories.</p> <p><b>l_train</b> (Obu_BasicTypes_Pkg::L_internal_Type): Length of the train [cm].</p> <p><b>m_brakeperct</b> (int): brake percentage. range from 0 to 300.</p> <p><b>v_maxtrain</b> (Obu_BasicTypes_Pkg::V_internal_Type): maximum speed of the train in km/h.</p> <p>needs to be changed to cm/sec</p> <p><b>m_axleLoad</b> (M_AXLELOADCAT): axle load category according to 3.18.3.2</p> <p><b>m_airTight</b> (M_AIRTIGHT): airtight system presence according to 3.18.3.2</p> <p><b>m_loadingGauge</b> (M_LOADINGGAUGE): loading gauge category according to 3.18.3.2</p> |
| Source      | Driver Machine Interface (DMI)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                                                       |                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description                                                           | Information carries the message received from RBC. Information is only used when the valid flag is true and the message source is Radio. Other information is not relevant. Information is evaluated as long as the validation procedure is not completed and a validation request with the RBC is pending. |
| Source                                                                | Radio Transmission Module (RTM)                                                                                                                                                                                                                                                                             |
| Type                                                                  | Common_Types_Pkg::ReceivedMessage_T                                                                                                                                                                                                                                                                         |
| Valid range of values                                                 | Input with valid information is indicated with the valid flag.                                                                                                                                                                                                                                              |
| Behaviour when value is at boundary                                   | n/a                                                                                                                                                                                                                                                                                                         |
| Behaviour for values out of valid range                               | When valid flag indicates false the data to be used is assumed to be default values. The component is not used when valid flag is false.                                                                                                                                                                    |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | No checking on individual values is done in this part of the openETCS EVC. We assume - if necessary - appropriate checks are part of the interface layer (e.g., CRC checks) This type of checks is not in the scope of the openETCS project.                                                                |

|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <p>Actual train data of the evc. Train data received via DMI from the driver. The availability of data is indicated with the valid flag. The data is expected as a mandatory parameter during start of mission. In the current implementation it is not supported to change data after a mission has been started. The structure consists of the following components:</p> <p><b>valid</b> (bool): valid indicator for this component. Valid indicates the data are updated after start-up of the system. The actual status of trainData is stored in the updatedStatus information.</p> <p><b>acknowledgedByDriver</b> (bool): Indicates this component has been validated by the driver.</p> <p>redundant information to status. Needs cleaning</p> <p><b>trainCategory</b> (NC_TRAIN): Train category used for the static speed profile calculation.</p> <p><b>cantDeficiency</b> (NC_CDTRAIN): Cant deficiency train category</p> <p><b>trainLength</b> (Obu_BasicTypes_Pkg::L_internal_Type): Length of the train [cm].</p> <p><b>brakePercentage</b> (int): brake percentage. range from 0 to 300.</p> <p><b>maxTrainSpeed</b> (Obu_BasicTypes_Pkg::V_internal_Type): maximum speed of the train in km/h.</p> <p>needs to be changed to cm/sec</p> <p><b>loadingGauge</b> (M_LOADINGGAUGE): loading gauge category according to 3.18.3.2</p> <p><b>axleLoadCategory</b> (M_AXLELOADCAT): axle load category according to 3.18.3.2</p> <p><b>airTightSystem</b> (M_AIRTIGHT): airtight system presence according to 3.18.3.2</p> <p><b>axleNumber</b> (int): axle number according to 3.18.3.2</p> <p><b>numberNationalSystems</b> (int): The number of national systems available in the train.</p> <p><b>nationalSystems</b> (Packet_TrainTypes_Pkg::aNID_NTC_T): National Systems available in the train. The elements 0 .. numberNationalSystems - 1 are carrying the relevant data.</p> <p><b>numberTractionSystems</b> (int): The number of traction systems available in the train.</p> <p><b>tractionSystems</b> (Packet_TrainTypes_Pkg::aTractionIdentity_T): Traction Systems available in the train. The elements 0 .. numberTractionSystems - 1 are carrying the relevant data.</p> |

#### 340 5.5.2 Interface

Figure 11. TrackAtlas component SysML diagram

341 An overview of the interface of component TrackAtlas is shown in Figure 11. The inputs  
342 and outputs are described in detail in Section 5.5.2.1 respectively 5.5.2.2. Subcomponents are  
343 described in Section 5.5.3.

344 **5.5.2.1 Inputs**

345 **5.5.2.1.1 [Input 1 name]**

|                                                                        |                                                                                                   |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Input name                                                             | [Name of the input]                                                                               |
| Description                                                            | [Brief description of the input]                                                                  |
| Source                                                                 | [Name of the source component]                                                                    |
| Type                                                                   | [Type of the input]                                                                               |
| Valid range of values                                                  | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                    | [Description of components behaviour when input value is at bound-ary]                            |
| Behaviour for values out of valid range                                | [Description of components behaviour when input value is out of valid range]                      |
| Behaviour when value is erroneous, absent or un-wanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

346 **5.5.2.1.2 [Input 2 name]**

|                                     |                                                                        |
|-------------------------------------|------------------------------------------------------------------------|
| Input name                          | [Name of the input]                                                    |
| Description                         | [Brief description of the input]                                       |
| Source                              | [Name of the source component]                                         |

| Valid range of values               | [Complete list of valid values]                                        |
| Behaviour when value is at boundary | [Description of components behaviour when input value is at bound-ary] |

Behaviour for values out of valid range [Description of components behaviour when input value is out of valid range]

Behaviour when value is erroneous, absent or un-wanted (i.e. spurious) [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | [Name of the output]                                                                              |
| Description                                                           | [Brief description of the output]                                                                 |
| Destination                                                           | [Name of the destination component(s)]                                                            |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 349 5.5.2.2.2 [Output 2 name]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | [Name of the output]                                                                              |
| Description                                                           | [Brief description of the output]                                                                 |
| Destination                                                           | [Name of the destination component(s)]                                                            |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

### 350 5.5.3 Subcomponents

#### 351 5.5.3.1 StoreRaw\_NV

##### 352 5.5.3.1.1 Component Requirements

|                     |                                     |
|---------------------|-------------------------------------|
| Component name      | StoreRaw_NV                         |
| Link to SCADE model | <a href="http://???">http://???</a> |

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

### 353 5.5.3.1.2 Interface

354 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
355 above) respectively the SCADE generated documentation.

### 356 5.5.3.2 Build\_GradientProfile

#### 357 5.5.3.2.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | Build_GradientProfile                                                       |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

### 358 5.5.3.2.2 Interface

359 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
360 above) respectively the SCADE generated documentation.

### 361 5.5.3.3 Build\_MA

#### 362 5.5.3.3.1 Component Requirements

|                |          |
|----------------|----------|
| Component name | Build_MA |
|----------------|----------|

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

### 363 5.5.3.3.2 Interface

364 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
365 above) respectively the SCADE generated documentation.

### 366 5.5.3.4 Build\_MRSP

#### 367 5.5.3.4.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | Build_MRSP                                                                  |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 368 5.5.3.4.2 Interface

369 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
370 above) respectively the SCADE generated documentation.

### 371 5.5.3.5 Manage\_EmergencyStop

#### 372 5.5.3.5.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | Manage_EmergencyStop                                                        |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

### 373 5.5.3.5.2 Interface

374 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
375 above) respectively the SCADE generated documentation.

### 376 5.5.3.6 C\_P003V1\_OBU\_P003\_OBU

#### 377 5.5.3.6.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | C_P003V1_OBU_P003_OBU                                                       |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 378 5.5.3.6.2 Interface

379 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
380 above) respectively the SCADE generated documentation.

### 381 5.5.3.7 GradientProfile\_to\_DMI

#### 382 5.5.3.7.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | GradientProfile_to_DMI                                                      |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

### 383 5.5.3.7.2 Interface

384 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
385 above) respectively the SCADE generated documentation.

### 386 5.5.3.8 Manage\_MA\_Request

#### 387 5.5.3.8.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | Manage_MA_Request                                                           |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Jakob Gärtner, LEA                                                          |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

### 388 5.5.3.8.2 Interface

389 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
390 above) respectively the SCADE generated documentation.

### 391 5.5.3.9 TA\_to\_ML

392 **5.5.3.9.1 Component Requirements**

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | TA_to_ML                                                                    |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |

|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description            | <p>The level management subsystem receives level transition order tables and selects the order with the highest probability. It stores the information about the selected transition order and transits to the requested level once the train passes the location of the level transition.</p> <p>If required, the driver is asked to acknowledge the transition, in case of no acknowledgment or if conditions for the level transition are not fulfilled, the train gets tripped.</p> <p>On the most abstract level the design consists of the <i>manage_priorities</i> function which takes the level transition order priority tables as inputs and computes the highest priority transition.</p> <p>This transition order is fed to the <i>computeLevelTransitions</i> operator. This operator consists of three main parts. The <i>ComputeTransitionConditions</i> operator that emits the fulfilled conditions to change from a given level to a new level, the <i>LevelStateMachine</i> that stores the current level and takes the computed change conditions as input for possible level transitions and finally the <i>driverAck</i> operator which contains a state machine that stores the information whether the system is currently waiting for a driver acknowledge and emits the train trip information if necessary.</p> |
| Input documents        | Subset-026, Chapter 5.10                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Safety integrity level | 4                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Description            | <p>The main purpose of the function is to calculate the locations of linked and unlinked balise groups (BGs) and the current train position while the train is running along the track. In detail, the calculateTrainPosition function provides a couple of essential subfunctions for the onboard unit. These are mainly:</p> <ul style="list-style-type: none"> <li>• Creating and maintaining an obu internal coordinate system for all types of location based data.</li> <li>• Storing all linked and unlinked balise groups resulting from over passing or from announcements (linking information) from the track.</li> <li>• Calculating and maintaining the locations of all stored balise groups during the train trip, based on odometry and linking information.</li> <li>• Permanently calculating the current train position based on odometry and passed balise group information.</li> <li>• Providing the last recently passed linked balise group as the LRBG.</li> <li>• Providing additional position attribute information.</li> <li>• Deleting stored balise groups, when appropriate.</li> <li>• Detecting linking consistency errors.</li> <li>• Determining, if linking is used on board.</li> </ul> <p>The calculation algorithms for locations and positions are implemented as specified in <a href="https://github.com/openETCS/SRS-Analysis/blob/master/System%20Analysis/WorkingRepository/Group4/SUBSET_26_3-6/DetermineTrainLocationProcedures.pdf">https://github.com/openETCS/SRS-Analysis/blob/master/System%20Analysis/WorkingRepository/Group4/SUBSET_26_3-6/DetermineTrainLocationProcedures.pdf</a></p> |

## 447 5.7.2 Interface

448 An overview of the interface of component calculateTrainPosition is shown in Figure ???. The  
 449 inputs and outputs are described in detail in Section 5.7.2.1 respectively 5.7.2.2. Subcomponents  
 450 are described in Section 5.7.3.

### 451 5.7.2.1 Inputs

#### 452 5.7.2.1.1 currentOdometry

| Description            | <p>Calculates the location of a just overpassed balise group related to the list of all so far known balise groups. If the just overpassed balise group has been announced via linking (packet 5) previously, it's location is adjusted to the best-of combination of linking and odometry information. If the just overpassed BG is a linked balise group, the locations of all known balise groups ahead and astern are recalculated with the just overpassed balise group as the one with minimized location uncertainties.</p> <p>If the overpassed balise group announces balise groups ahead via linking (packet 5), these balise groups are added to the list of known balise groups.</p> |

| Description         | When balise groups ahead are announced via radio, addAnnounced-BGs adds these balise groups to the list of known balises groups and calculates their locations.                                                                                                                                                             |

| Description            | Calculates the current train position based on the odometry and the list of known balise groups. Provides the last passed linked balised group and the linked balise group passed previously to the last passed linked balise group. Provides the last passed unlinked balise group. Determines, if linking is used on board. |

| SCADE designer         | Uwe Steinke, Siemens AG                                                                                                                                                                                                                                                                                                                                                            |
| Description            | Detects, when the range of a linked BG (where it is expected to be found) is left and the BG has not been passed yet. Steadily observes the current train position and detects, when the train leaves the expectation window of any BG. When this happens, checks whether it is a linked BG and has been marked as passed. If not, it was not found within its expectation window. |

|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <p>The task of SDM is to monitor the speed of the train and the train location and as such to ensure that the speed remains within the given speed and distance limits. This block is based on [1, Chapt. 3.13]. The integration node “SpeedSupervision_Integration” takes as input (1) movement related information such as train speed, train position and acceleration, (2) train related information such as brake information and train length, and (3) track related information such as speed and distance limits and national values.</p> <p>Based on this information a speed profile is calculated. Speed restrictions create target speeds (targets) that have to be followed. For each such target braking curves are generated to supervise at which location of the track the train must apply the brake. In case of no target restrictions the train may accelerate to the supervised maximum speed of the speed profile. These calculations lead to commands being sent to the driver and the brake system.</p> <p>The functionality is modeled using eight subcomponents, as shown in Figure 14, which are explained in Section 5.8.3.</p> <p>The current status of the analysis of “SDM” and a functional breakdown can be found in a separate document, SpeedSupervision_analysis.pdf.</p> |

## 504 5.8.2 Interface

505 An overview of the interface of component SpeedSupervision\_integration is shown in Figure 14.  
 506 The inputs and outputs are described in detail in Section 5.8.2.1 respectively 5.8.2.2. Sub  
 507 components are described in Section 5.8.3.

### 508 5.8.2.1 Inputs

#### 509 5.8.2.1.1 National Values

|                       |                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------|
| Input name            | NationalValues                                                                                                               |
| Description           | This input is packet 3 or 203 of [1, Chapt. 8], describing the national values.                                              |
| Source                | TrackAtlas; current release, hard wired constant: cP3NationalValuesUtrechtAmsterdam                                          |
| Type                  | P3_NationalValues_T                                                                                                          |
| Valid range of values | P3_NationalValues_T is a complex data type, valid ranges are specified in SRS Subset-026-7, no further checks are done here. |

|                                                                       |                                                                         |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------|
| Behaviour when value is at boundary                                   | n/a                                                                     |
| Behaviour for values out of valid range                               | n/a                                                                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Not checked; node must not be called without reasonable National Value. |

#### 510 5.8.2.1.2 Train Position

|                                                                       |                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input name                                                            | TrainPosition                                                                                                                                                                                                                                                                                                                                         |
| Description                                                           | This input is the current train position.                                                                                                                                                                                                                                                                                                             |
| Source                                                                | calculateTrainPosition                                                                                                                                                                                                                                                                                                                                |
| Type                                                                  | trainPosition_T                                                                                                                                                                                                                                                                                                                                       |
| Valid range of values                                                 | <p>trainPosition_T is a complex data type. Value valid must not be false for proper function and it may not be properly checked in current release. Furthermore, reversing (decreasing positions, reverse flag set) is currently NOT supported and leads to undefined behaviour. No brake will be thrown in this occasion.</p> <p>To be completed</p> |
| Behaviour when value is at boundary                                   | Not checked, may overflow.                                                                                                                                                                                                                                                                                                                            |
| Behaviour for values out of valid range                               | Currently not checked.                                                                                                                                                                                                                                                                                                                                |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Not checked; node must not be called without reasonable position data. Valid flag is not checked (bug), as SDM has not yet implemented exception handling on unacceptable input data.                                                                                                                                                                 |

| Description                                                           | This input is a set of train related properties.                                                                                                                                      |
| Source                                                                | maintainTrainProperties                                                                                                                                                               |
| Type                                                                  | trainProperties_T                                                                                                                                                                     |
| Valid range of values                                                 | trainProperties_T is a complex type but referenced only d_baliseAntenna_2_frontend.nominal: Obu_BasicTypes_Pkg::L_internal_Type No valid range defined, neither checked.              |
| Behaviour when value is at boundary                                   | n/a                                                                                                                                                                                   |
| Behaviour for values out of valid range                               | n/a                                                                                                                                                                                   |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Value is only evaluated in Level 1. Low values (e.g. invalid-default 0) will lead to early trip, brake and alike. Larger values will lead to late braking, possibly numeric overflow. |

#### 513 5.8.2.1.5 Train Data

|             |                                                           |
|-------------|-----------------------------------------------------------|
| Input name  | trainData                                                 |
| Description | This input is a set of train related inputs from the TIU. |
| Source      | manageTrainData                                           |
| Type        | trainData_T                                               |

|                                                                       |                                                                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Valid range of values                                                 | trainData_T is a complex type. No valid range defined, neither checked. The source is trusted.                                                    |
| Behaviour when value is at boundary                                   | n/a                                                                                                                                               |
| Behaviour for values out of valid range                               | n/a                                                                                                                                               |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Must be valid for SDM to function. Valid flag is not checked (bug), as SDM has not yet implemented exception handling on unacceptable input data. |

#### 514 5.8.2.1.6 Track Data

|                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Description                                                           | This input is a set of track related input data, containing the MRSP, the Gradient Profile and the Movement Authority. And its associated update flags to optimize data handling.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Source                                                                | TrackAtlas                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Type                                                                  | DataForSupervision_nextGen_t                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Valid range of values                                                 | <p>DataForSupervision_nextGen_t is a wrapper the three mentioned complex types. The fresh-flags are seen as an optimization hint. From specification, all three containers must contain valid data for SDM to function. Ranges or sanity are not checked. The source is trusted.</p> <p><b>MA</b> Must always contain a valid Movement Authority, else the brake is commanded.</p> <p><b>GradientProfile</b> As per SRS, this must always contain a valid description up to the end of the MA.</p> <p><b>MRSP</b> Must at least a profile for the train's maximum speed, if no other restriction is known.</p> |
| Behaviour when value is at boundary                                   | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Behaviour for values out of valid range                               | If the MA is not valid the brake should be commanded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Absence of minimal MRSP is not detected but trusted. Validity of MA is not checked up front.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Behaviour for values out of valid range                               | Valid target values of speed and distance are not artificially limited to a sane range and are passed through data from track input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | .valid may be false if no target is supervised or known, other values of this output must be ignored then.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 518 5.8.2.2.3 sdmCommands

|                                     |                                                                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output name                         | sdmCommands                                                                                                                                                                                                                   |
| Description                         | This output gives some intermediate results of operator SDM_Commands. It is currently used for test purposes only.                                                                                                            |
| Destination                         | n/a, null-sink                                                                                                                                                                                                                |
| Type                                | SDM_Commands_T (complex)                                                                                                                                                                                                      |
| Valid range of values               | Containing values are either boolean command-trigger flags, the internal state of the SDM_commands state-machine or speed/distance types with guarding bool valid flag. For in-depth description see generated documentation. |
| Behaviour when value is at boundary | n/a                                                                                                                                                                                                                           |

Behaviour for values out of valid range

- Bool are always in range.
- The internal state `SupervisionStatus_T` is `Undefined_Supervision` at initialization and renders the output `sdmToDMI`'s valid flag to false.
- Speeds `estimatedSpeed`, `permittedSpeed`, `releaseSpeed`, `mrtdSpeed`, `sbiSpeed` and distance `targetDistance` must be ignored and contain invalid values if the corresponding valid-flag is false. Valid-marked outputs are not artificially limited to a sane range and rely on correctly specified algorithms.

Behaviour when value is erroneous, absent or unwanted (i.e. spurious)

Overall `.valid` is always set, individual speeds have their corresponding valid flag. Values may not have a valid output depending on the situation.

519 **5.8.2.2.4 brakeCmd**

|             |                                                                                                                                         |

| Description            | <p>The motivation for this operator is to convert all inputs of SDM that contain information about length, speed, distance, and acceleration defined as integer into <code>real</code> to allow automatically the highest precision in the calculations by the meaning of floating point operations. In addition, to ease the modeling, inside block “Speed Supervision” only units meters (<math>[m]</math>), seconds (<math>[s]</math>), meters per second (<math>[\frac{m}{s}]</math>), and meters per square second (<math>[\frac{m}{s^2}]</math>) are used. This operator forwards input messages, takes data from complex data types or transforms inputs messages into an internal type thereby converting int to real.</p> |

| SCADE designer      | Benjamin Beichler, University of Rostock<br>Thorsten Schulz, University of Rostock                                                                                                                                                                  |

**Description** This operator calculates/updates the list of targets to be supervised by SDM. Taking the current movement authority, the most restrictive speed profile and the current maximum safe front end position as an input, the operator outputs a list of MRSP-Targets and a Limit-of-Authority-Target (LoA) or, if an End of Authority is known, the End-of-Authority-Target (EoA) and the Supervised Location (SvL). Since LoA and SvL are mutually exclusive but both result in a trip-target, they use the same flow.

#### **Derivation of Targets from Movement Authority**

The *Movement Authority* creates three types of targets:

**Limit of Authority (LoA)** if the End of Authority is not yet known to the RBC and is accompanied by a speed limit for the given location.

**End Of Authority (EoA)** requires the train to stop and creates a Service Brake Target

**Supervised Location (SvL)** is derived from the EoA but results in an emergency brake target and on passing in a trip. The SvL may be offset from the EoA to the Overlap (OL) or the Dangerpoint (DP).

#### **Derivation of Targets from MRSP**

According to [1, Chapt. 3.13.8.2], every speed decrease of the MRSP is used to derive a target. Therefore in every cycle in which the MRSP is updated, the operator iterates through the entire MRSP searching for all MRSP targets. For this purpose, every element of the MRSP is compared with its successor.

#### **Update of Targets**

In every cycle the operator monitors whether all targets are already passed. To this end, it iterates over the list of targets comparing the current front end position with the target's location.

| Description            | This operator implements the braking models. At this stage only the lamda trains (conversion) model is implemented. The output of the conversion model are a location independent, but highly National Values dependent, braking curves. One for the service brake and one for the emergency brake. As a side product, the model related brake build-up times are also generated. |

|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description            | For each type of target a certain braking curve has to be calculated. This curve enables proactive monitoring of the train's speed. A reverse lookup on this braking curve indicates, where the train has to start braking given the current speed. The braking curve does not depend on the actual train status. As a consequence the braking curve stays constant over time. As a legitimate simplification the calculation of the braking curve is not extended past the estimated front end position of the train. |

| Description            | <p>This operator calculates the various locations and speeds needed to determine the speed and distance monitoring commands. The current implementation of functionality is stateless and requires a complete recalculation each cycle.</p> <p>This operator gathers all necessary input values and computes some frequently used intermediate values in the operators <code>surplusTractionDeltas</code> and <math>v_{bec}</math>. The other input preparation operator is the <code>TargetSelector</code> whose main task is to dissect the list of targets to find the Most Restrictive Target. The accompanying braking curves are extracted and promoted to trailing location calculations. Also the special values of the EOA are exposed.</p> <p>The operator creates the requested values for the commands package. These are in particular the preindication locations for EBD and SBD based targets, the release speed monitoring start locations, the locations for target speed monitoring of the I-, W-, P- and FLOI-curve, the related FLOI speed and the location of the permitted speed supervision limit. Included in the output are also certain flags for the validity of linked values.</p> |

| Description            | <p>This operator models the speed and distance monitoring commands. More precisely, it triggers the service or emergency brake and outputs the current supervision status of the OBU together with information on speeds and locations to the driver.</p> <p>The OBU can be in any of three types of speed and distance monitoring modes: ceiling speed monitoring, release speed monitoring and target speed monitoring. We use a state machine to model the switching between the three modes: each state models a mode and a transition between to states is enabled if the condition two switch between the two corresponding modes is evaluated to true. In each mode, the OBU can be in up to five different supervision stati. The behavior of changing from one status to another is also modeled as a state machine. As a result, the model is a hierarchical state machine.</p> |

| Description         | <p>The component builds a position report for the RBC, i.e., message 132, and provides it as an output. There are two triggers for sending message 132:</p> <ol style="list-style-type: none"> <li>1. at least one of the triggers of the position report parameters (packet 58) holds or</li> <li>2. one of the events enabling the sending of the report occurs.</li> </ol> <p>As the core position report (i.e., packet 0 or 1) is included in other packets, the component also provides this core position report at every clock cycle. At most one of the two packets is valid.</p> |

5.9.2 Interface

An overview of the interface of component Provide\_Position\_Report is shown in Figure 15. The inputs and outputs are described in detail in Section 5.9.2.1 respectively 5.9.2.2. Subcomponents are described in Section 5.9.3.

5.9.2.1 Inputs

5.9.2.1.1 inMessage

|             |                                                                                          |
|-------------|------------------------------------------------------------------------------------------|
| Input name  | inMessage                                                                                |
| Description | Input message from the bus (to extract Packet 58, the position report parameters).       |
| Source      | Manage_TrackSideInformation_Integration_Pkg::<br>Manage_TrackSideInformation_Integration |

|                                                                       |                                           |
|-----------------------------------------------------------------------|-------------------------------------------|
| Type                                                                  | Common_Types_Pkg::ReceivedMessage_T       |
| Valid range of values                                                 | as defined in SCADE                       |
| Behaviour when value is at boundary                                   | n/a                                       |
| Behaviour for values out of valid range                               | n/a                                       |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | If valid is false, then input is ignored. |

571 **5.9.2.1.2 systemTime**

|                                                                       |                                                         |
|-----------------------------------------------------------------------|---------------------------------------------------------|

| SCADE designer         | Christian Stahl, TWT                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description            | This operator builds nine position report messages – there can be up to nine errors, and for each error an individual report has to be sent. The fold operator ensures that the first report is invalid if the first error is not present but there exists an error in the error field. In other words, one valid report will be built. If the errorVector does not contain a single error, then at least one report needs to be built (if the operator is triggered). |

| SCADE designer         | Christian Stahl, TWT                                                                                                                                                                                                                                                                                                                                                                        |
| Description            | The component adds the current reported BG to the list of BGs for which a report has been sent. Adding of this BG is performed according to the FIFO method.                                                                                                                                                                                                                                |

| Description | <p>The <i>MoRC_HO</i> component implements the handover process between two different RBCs and the session management (<i>MoRC</i> = management of radio communication) with each of them.</p> <p><i>MoRC_HO</i> comprises</p> <ul style="list-style-type: none"> <li>• the <i>processHandingOver</i> subcomponent performing the handover process from the handing over RBC to the accepting RBC,</li> <li>• two instances of <i>MoRC_Main_v2</i> representing the session management with up to two RBCs in parallel</li> <li>• a <i>mobileDataRouter_out</i> subcomponent for routing the OBUs output data stream to both RBCs and switching over from the handing over RBC to the accepting RBC.</li> </ul> <p><i>processHandingOver</i> consumes the relevant messages received from track and controls the registration with the radio network, the session termination with the handing over RBC and the session establishment with the accepting RBC. To achieve this, it controls up to two instances of <i>MoRC_Main_v2</i>. Additionally, it monitors the current train position and performs the handing over at the ordered track location. The number of <i>MoRC</i> instances used is configurable and depends on the number of mobile modems (1 or 2 ) available on board.</p> <p>The management of radio communication <i>MoRC_Main_v2</i> implements the onboard management part of a single communication session with the track, i.e. a single RBC. It controls the establishing, maintaining and termination process of a radio communication session and steers the underlying communication safety layer and the mobile device. Those and the data transfer itself are not part of the function.</p> <p><i>MoRC_HO</i> requests position reports to be sent to the appropriate RBC and cooperates with the <i>InformationFilter</i> component for input data stream filtering and buffering as required by the handover process.</p> |

## 628 5.10.2 Interface

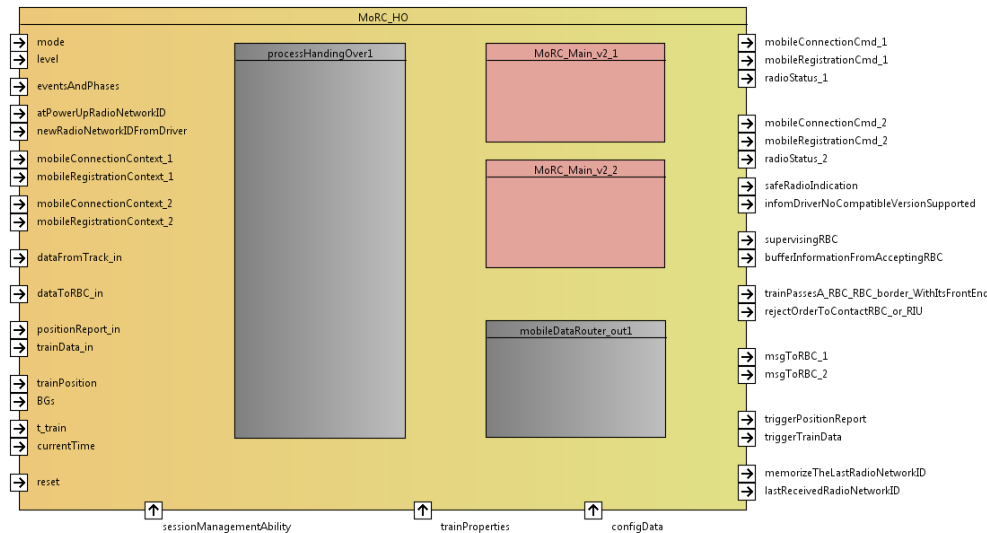

Figure 16. Manage\_Radio\_Communication component SysML diagram

629 An overview of the interface of component MoRC\_HO is shown in Figure 16. The inputs and  
630 outputs are described in detail in Section 5.10.2.1 respectively 5.10.2.2. Sub components are  
631 described in Section 5.10.3.

632 5.10.2.1 Inputs

633 5.10.2.1.1 [mode]

|                                                                       |                                |
|-----------------------------------------------------------------------|--------------------------------|

#### 659 5.10.2.2.6 [mobileRegistrationCmd\_2]

|             |                         |
|-------------|-------------------------|
| Output name | mobileRegistrationCmd_2 |
|-------------|-------------------------|

|             |                                                     |
|-------------|-----------------------------------------------------|
| Description | Commands to mobile 2 for radio registration control |
|-------------|-----------------------------------------------------|

|             |                       |
|-------------|-----------------------|
| Destination | API to radio mobile 2 |
|-------------|-----------------------|

|      |                                        |
|------|----------------------------------------|
| Type | RCM_Types_Pkg::mobileRegistrationCmd_T |
|------|----------------------------------------|

|                       |     |
|-----------------------|-----|
| Valid range of values | n/a |
|-----------------------|-----|

|                                     |     |
|-------------------------------------|-----|
| Behaviour when value is at boundary | n/a |
|-------------------------------------|-----|

|                                         |     |
|-----------------------------------------|-----|
| Behaviour for values out of valid range | n/a |
|-----------------------------------------|-----|

Behaviour when value is erroneous, absent or unwanted (i.e. spurious) n/a

#### 660 5.10.2.2.7 [safeRadioIndication]

|                                                                       |                                                                         |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------|
| Output name                                                           | safeRadioIndication                                                     |
| Description                                                           | Safe radio indication for DMI                                           |
| Destination                                                           | DIM via DMI interface                                                   |
| Type                                                                  | RCM_Session_Types_Pkg::safeRadioConnectionIndication_T                  |
| Valid range of values                                                 | srci_noConnection   srci_connectionLost_setupFailed   srci_connectionUp |
| Behaviour when value is at boundary                                   | n/a                                                                     |
| Behaviour for values out of valid range                               | n/a                                                                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | n/a                                                                     |

#### 661 5.10.2.2.8 [supervisingRBC]

|                                                                       |                                                                                                                         |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Output name                                                           | supervisingRBC                                                                                                          |
| Description                                                           | Designates the current supervising RBC for the InformationFilter to support input message filtering and buffering there |
| Destination                                                           | InformationFilter                                                                                                       |
| Type                                                                  | Handover_Pkg::connection_ids_T                                                                                          |
| Valid range of values                                                 | n/a                                                                                                                     |
| Behaviour when value is at boundary                                   | n/a                                                                                                                     |
| Behaviour for values out of valid range                               | n/a                                                                                                                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | n/a                                                                                                                     |

#### 662 5.10.2.2.9 [bufferInformationFromAcceptingRBC]

|                                                                       |                                                                                  |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Output name                                                           | bufferInformationFromAcceptingRBC                                                |
| Description                                                           | Informs the InformationFilter to buffer messages received from the accepting RBC |
| Destination                                                           | InformationFilter                                                                |
| Type                                                                  | bool                                                                             |
| Valid range of values                                                 | true   false                                                                     |
| Behaviour when value is at boundary                                   | n/a                                                                              |
| Behaviour for values out of valid range                               | Code generation fails                                                            |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | Misbehaviour                                                                     |

| Description | <p>The function <i>processHandingOver</i> implements the process of handing over the OBU from one RBC to a subsequent RBC. This process is based upon orders received from balise and radio.</p> <p><i>processHandingOver</i> terminates the radio session with the current - the handing over - RBC and establishes a session with the new - the accepting - RBC. Dependent on the availability of one or two mobile modems onboard, <i>processHandingOver</i> is able to manage two sessions in parallel or subsequently. For this, it steers two instances of MoRC_Main_v2.</p> <p><i>processHandingOver</i> controls the switchover of the OBUs output data stream to track from the handing over RBC to the accepting RBC and provides the InformationFilter with the supervising RBC information for message buffering and filtering.</p> <p>It in addition, <i>processHandingOver</i> monitors the current train position and executes the handover, when the train front passes the appropriate location.</p> |

| SCADE designer      | Uwe Steinke, Siemens                                                                                                                                                                                  |

Description The function *MoRC\_Main\_v2* implements the session states establishing, maintaining and terminating as described in Subset-026, chap. 3.5. A SCADE state machine reflects this state model accurately. Within each of the states, the activities needed as long as the state is active, are performed.

*MoRC\_Main\_v2* is related to exactly one of the radio mobile modems onboard, monitors its status and controls the processes of registration to the radio network, connecting to one RBC and establishing a radio session with the RBC. *MoRC\_Main\_v2* communicates with its mobile modem directly via the API.

As the OBU is required to manage up to two RBCs, two instances of *MoRC\_Main\_v2* are used.

In addition, *MoRC\_Main\_v2* generates the radio connection indication for the driver.

## 707 5.12.2 Interface

708 An overview of the interface of component ManageDMIOOutput is shown in Figure 18. The inputs  
 709 and outputs are described in detail in Section 5.12.2.1 respectively 5.12.2.2. Subcomponents are  
 710 described in Section 5.12.3.

### 711 5.12.2.1 Inputs

#### 712 5.12.2.1.1 [Input 1 name]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Input name                                                            | [Name of the input]                                                                               |
| Description                                                           | [Brief description of the input]                                                                  |
| Source                                                                | [Name of the source component]                                                                    |
| Type                                                                  | [Type of the input]                                                                               |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when input value is at boundary]                             |
| Behaviour for values out of valid range                               | [Description of components behaviour when input value is out of valid range]                      |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 713 5.12.2.1.2 [Input 2 name]

|                                         |                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------|
| Input name                              | [Name of the input]                                                          |
| Description                             | [Brief description of the input]                                             |
| Source                                  | [Name of the source component]                                               |
| Type                                    | [Type of the input]                                                          |
| Valid range of values                   | [Complete list of valid values]                                              |
| Behaviour when value is at boundary     | [Description of components behaviour when input value is at boundary]        |
| Behaviour for values out of valid range | [Description of components behaviour when input value is out of valid range] |

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|

#### 714 5.12.2.2 Outputs

##### 715 5.12.2.2.1 [Output 1 name]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | [Name of the output]                                                                              |
| Description                                                           | [Brief description of the output]                                                                 |
| Destination                                                           | [Name of the destination component(s)]                                                            |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

##### 716 5.12.2.2.2 [Output 2 name]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | [Name of the output]                                                                              |
| Description                                                           | [Brief description of the output]                                                                 |
| Destination                                                           | [Name of the destination component(s)]                                                            |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 730 5.12.3.3.2 Interface

731 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
732 above) respectively the SCADE generated documentation.

### 733 5.12.3.4 toEntryRequest

#### 734 5.12.3.4.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | toEntryRequest                                                              |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Bernd Hekele, DB Netz AG                                                    |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 735 5.12.3.4.2 Interface

736 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
737 above) respectively the SCADE generated documentation.

### 738 5.12.3.5 sendBrakesToDMI

#### 739 5.12.3.5.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | sendBrakesToDMI                                                             |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Bernd Hekele, DB Netz AG                                                    |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 740 5.12.3.5.2 Interface

741 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
742 above) respectively the SCADE generated documentation.

### 743 5.12.3.6 manageDMI\_Output

#### 744 5.12.3.6.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | manageDMI_Output                                                            |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Bernd Hekele, DB Netz AG                                                    |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 745 5.12.3.6.2 Interface

746 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
747 above) respectively the SCADE generated documentation.

748 **5.12.3.7 sendTrainData**

749 **5.12.3.7.1 Component Requirements**

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | sendTrainData                                                               |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Bernd Hekele, DB Netz AG                                                    |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

750 **5.12.3.7.2 Interface**

751 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
752 above) respectively the SCADE generated documentation.

753 **5.12.3.8 sendVersion**

754 **5.12.3.8.1 Component Requirements**

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | sendVersion                                                                 |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Bernd Hekele, DB Netz AG                                                    |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

755 **5.12.3.8.2 Interface**

756 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
757 above) respectively the SCADE generated documentation.

### 758 5.12.3.9 sendLevelListPkg

#### 759 5.12.3.9.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | sendLevelListPkg                                                            |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Bernd Hekele, DB Netz AG                                                    |
| Description            | [Brief description of functionality]                                        |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 760 5.12.3.9.2 Interface

761 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
762 above) respectively the SCADE generated documentation.

## 5.13 F2.12: ManageTIUInput

764 section and corresponding subsections have to be completed

#### 765 5.13.1 Component Requirements

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| Component name         | ManageTIUInput                                                              |
| Link to SCADE model    | <a href="http://???">http://???</a>                                         |
| SCADE designer         | Bernd Hekele, DB Netz AG                                                    |
| Description            | [Brief description of the components functionality]                         |
| Input documents        | Subset-026, Chapter ??<br>Subset-026, Chapter ??<br>Subset-026, Chapter ??? |
| Safety integrity level | 4                                                                           |
| Time constraints       | [If applicable description of time constraints, otherwise n/a]              |
| API requirements       | [If applicable description of API requirements, otherwise n/a]              |

#### 766 5.13.2 Interface

Figure 19. ManageTIUInput SysML diagram

767 An overview of the interface of component ManageTIUInput is shown in Figure 19. The inputs  
768 and outputs are described in detail in Section 5.13.2.1 respectively 5.13.2.2. Subcomponents are  
769 described in Section 5.13.3.

770 **5.13.2.1 Inputs**

771 **5.13.2.1.1 [Input 1 name]**

|                                                                         |                                                                                                   |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Input name                                                              | [Name of the input]                                                                               |
| Description                                                             | [Brief description of the input]                                                                  |
| Source                                                                  | [Name of the source component]                                                                    |
| Type                                                                    | [Type of the input]                                                                               |
| Valid range of values                                                   | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                     | [Description of components behaviour when input value is at bound-ary]                            |
| Behaviour for values out of valid range                                 | [Description of components behaviour when input value is out of valid range]                      |
| Behaviour when value is erroneous, absent or un- wanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

772 **5.13.2.1.2 [Input 2 name]**

|                                     |                                                                        |
|-------------------------------------|------------------------------------------------------------------------|
| Input name                          | [Name of the input]                                                    |
| Description                         | [Brief description of the input]                                       |
| Source                              | [Name of the source component]                                         |
| Type                                | [Type of the input]                                                    |
| Valid range of values               | [Complete list of valid values]                                        |
| Behaviour when value is at boundary | [Description of components behaviour when input value is at bound-ary] |

Behaviour for values out of valid range [Description of components behaviour when input value is out of valid range]

Behaviour when value is erroneous, absent or unwanted (i.e. spurious) [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)]

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | [Name of the output]                                                                              |
| Description                                                           | [Brief description of the output]                                                                 |
| Destination                                                           | [Name of the destination component(s)]                                                            |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 775 5.13.2.2.2 [Output 2 name]

790 **5.14.2 Interface**

791 An overview of the interface of component ManageTIUOutput is shown in Figure 20. The inputs  
792 and outputs are described in detail in Section 5.14.2.1 respectively 5.14.2.2. Subcomponents are  
793 described in Section 5.14.3.

794 **5.14.2.1 Inputs**

795 **5.14.2.1.1 [Input 1 name]**

|                                     |                                                                        |
|-------------------------------------|------------------------------------------------------------------------|
| Input name                          | [Name of the input]                                                    |
| Description                         | [Brief description of the input]                                       |
| Source                              | [Name of the source component]                                         |
| Type                                | [Type of the input]                                                    |
| Valid range of values               | [Complete list of valid values]                                        |
| Behaviour when value is at boundary | [Description of components behaviour when input value is at bound-ary] |

|                                                                       |                                                                                                   |

808 **5.14.3.2.2 Interface**

809 For an overview of the interface of this internal component we refer to the SCADE model (cf. link  
810 above) respectively the SCADE generated documentation.

## 6<sup>811</sup> F3: Measure Train Movement

<sup>812</sup> This component is not part of the openETCS OBU currently and therefore no detailed description  
<sup>813</sup> is provided here.

## 7<sup>814</sup> F4: Manage Radio Communication

<sup>815</sup> This component is not part of the openETCS OBU currently and therefore no detailed description  
<sup>816</sup> is provided here.

## 8<sup>817</sup> F5: Manage JRU

<sup>818</sup> This component is not part of the openETCS OBU currently and therefore no detailed description  
<sup>819</sup> is provided here.

## 9 F6: DMI Controller

This chapter needs to be completed and a responsible developer has to be identified.

### 9.1 DMI

#### 9.1.1 Component Requirements

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| SCADE designer         | Valerio D'Angelo, DB Netz AG                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description            | The DMI controller interacts with the DMI display and is responsible for all procedures between the DMI display and Driver. Furthermore, the DMI controller will interact with the DMI Management to compute the received information (e.g. driver number request, ...) and send, if necessary, data or reports to the DMI Management (acknowledge, text messages...). The DMI Controller is a passive module, this means that all the processing are performed EVC-side, therefore the DMI Controller simply responds to the requests of the EVC or Driver and performs some checks according with the information received from EVC. |

#### 9.1.2 Interface

An overview of the interface of component DMI is shown in Figure 21. The inputs and outputs are described in detail in Section 9.1.2.1 respectively 9.1.2.2.

##### 9.1.2.1 Inputs

###### 9.1.2.1.1 DMI\_entry\_request

|             |                                                                   |
|-------------|-------------------------------------------------------------------|
| Input name  | DMI_entry_request                                                 |
| Description | Request to input data (e.g. driver id, Train running number etc.) |
| Source      | DMI Management                                                    |

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Type                                                                  | [Type of the input]                                                                               |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when input value is at boundary]                             |
| Behaviour for values out of valid range                               | [Description of components behaviour when input value is out of valid range]                      |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 829 9.1.2.1.2 DMI\_identifier\_request

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Input name                                                            | DMI_identifier_request                                                                            |
| Description                                                           | Request of the DMI informations                                                                   |
| Source                                                                | DMI Management                                                                                    |
| Type                                                                  | [Type of the input]                                                                               |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |

| Behaviour when value is at boundary     | [Description of components behaviour when input value is at boundary]        |
| Behaviour for values out of valid range | [Description of components behaviour when input value is out of valid range] |

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|

### 838 9.1.2.2 Outputs

#### 839 9.1.2.2.1 DMI\_identifier

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | DMI_identifier                                                                                    |
| Description                                                           | Information about DMI (e.g. version, cabin identifier etc.)                                       |
| Destination                                                           | DMI Management                                                                                    |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 840 9.1.2.2.2 DMI\_driver\_request

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | DMI_driver_request                                                                                |
| Description                                                           | Driver request or acknowledgement                                                                 |
| Destination                                                           | DMI Management                                                                                    |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 841 9.1.2.2.3 DMI\_train\_data\_ack

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | DMI_train_data_ack                                                                                |
| Description                                                           | Train data acknowledgement                                                                        |
| Destination                                                           | DMI Management                                                                                    |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 842 9.1.2.2.4 DMI\_status\_report

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | DMI_status_report                                                                                 |
| Description                                                           | The actual status of DMI (keep alive)                                                             |
| Destination                                                           | DMI Management                                                                                    |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 843 9.1.2.2.5 DMI\_text\_message\_ack

|                       |                                 |
|-----------------------|---------------------------------|
| Output name           | DMI_text_message_ack            |
| Description           | Text message acknowledgement    |
| Destination           | DMI Management                  |
| Type                  | [Type of the output]            |
| Valid range of values | [Complete list of valid values] |

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 844 9.1.2.2.6 DMI\_icons\_ack

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | DMI_icons_ack                                                                                     |
| Description                                                           | Icon acknowledgement                                                                              |
| Destination                                                           | DMI Management                                                                                    |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 845 9.1.2.2.7 DMI\_driver\_identifier

|                                         |                                                                               |
|-----------------------------------------|-------------------------------------------------------------------------------|
| Output name                             | DMI_driver_identifier                                                         |
| Description                             | Contains the default or entered driver identifier                             |
| Destination                             | DMI Management                                                                |
| Type                                    | [Type of the output]                                                          |
| Valid range of values                   | [Complete list of valid values]                                               |
| Behaviour when value is at boundary     | [Description of components behaviour when output value is at boundary]        |
| Behaviour for values out of valid range | [Description of components behaviour when output value is out of valid range] |

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|

#### 846 9.1.2.2.8 DMI\_train\_running\_number

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | DMI_train_running_number                                                                          |
| Description                                                           | Contains the default or entered train running number                                              |
| Destination                                                           | DMI Management                                                                                    |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

#### 847 9.1.2.2.9 DMI\_train\_data

|                                                                       |                                                                                                   |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Output name                                                           | DMI_train_data                                                                                    |
| Description                                                           | Contains the default or entered train data                                                        |
| Destination                                                           | DMI Management                                                                                    |
| Type                                                                  | [Type of the output]                                                                              |
| Valid range of values                                                 | [Complete list of valid values]                                                                   |
| Behaviour when value is at boundary                                   | [Description of components behaviour when output value is at boundary]                            |
| Behaviour for values out of valid range                               | [Description of components behaviour when output value is out of valid range]                     |
| Behaviour when value is erroneous, absent or unwanted (i.e. spurious) | [Description of components behaviour when value is erroneous, absent or unwanted (i.e. spurious)] |

## 10. F7: Manage TIU

849 This component is not part of the openETCS OBU currently and therefore no detailed description  
850 is provided here.
